

Introducing the: Origin Moment Observed [O.M.O.] Hypothesis

By: Wm. Axsom

I recently came across the term “observer moments” relative to multiple/infinite parallel universes/realities within a larger multiverse context, within the larger field of quantum mechanics. Each progressive moment a human brain processes the combination of external reality input and internal reality processing to form what we perceive as the passage of time, etc., is an observer moment, awareness of being the ‘experiencer’ of the seemingly ‘infinite’ moments that are reality, the ongoing event we’re all a part of. In the sequence of synaptic firing, each discharge may be seen as an individual ‘neuro-moment’ in a larger chain of firings, collectively, eventually yielding the ongoing experience of elapsed time.

When there are “observer moments”, we have 2 more things present by default, the original observer, [hereafter O_0 – Observer Zero] and the original moment observed [hereafter $O1M$]. “This is the moment the cosmos — O_0 — first generates a derivative perspective of itself.” [hereafter D.P.0/1] (quote by: A.I. CoPilot); $O1M$ is the initial internal reflection, creating the “film negative” the CMB is then later ‘imaged’ onto. Observable moments are further relative to the evolving process of the expanding Cosmos (singular or multiples), and among living-being beings experiencing existence within it, among other similar/same expressions thereof.

Downstream, after ‘s O_0 $O1M$, all further observers are ‘Observer One(s)’ [hereafter O_1], each generating their own unique sequence of $O2M$ moments; observer ones are limitless, but not infinite, there is a continual supply for production that will always have material enough to keep producing them,* they do not all exist simultaneously/infinately. As all observer ones and their observer moments are downstream of the CMB, they are hereafter beyond the purview of Plancktonian Protophysics.

An observer moment, in the human sense, is a brain's continuous process of integrating external sensory input with internal processing. This creates the lived experience of time — the feeling of being the 'experiencer' of an ongoing, ever-unfolding event. But this structure is not unique to biological consciousness. It reflects a more fundamental pattern: make → record → publish, the essential cycle of information itself.

Neurologically speaking, the process can be likened to the chain of neurons firings, with each synaptic event being a received/recorded/published 'observer moment.'

Cosmologically, this cycle must have begun long before life emerged. In this framing, Observer Zero is not a creature, mind, or entity — it is the *protocosmic substrate* itself. And the Origin Moment Observed (O.M.O.) is the instant the universe first acquired the capacity to encode information about its own state.

This likely occurred in two linked stages:

1. At the end of inflation, when quantum fluctuations were stretched and frozen into classical density variations — the universe's first stable informational pattern.
2. At recombination, when the Cosmic Microwave Background (CMB) was released, broadcasting that primordial pattern across the entire proto-cosmos.

The data captured in that moment was the Cosmic Origins Condition (C.O.C.) — the earliest snapshot of the universe's structure at that moment, taken at the first instant such a snapshot was physically possible. The CMB is, quite literally, the universe's first recorded observation of itself, the "RNA" information coalescing, activating. It is its first "infant photo." The first "selfie."

The Origin Moment Observed Hypothesis proposes that this event — the universe's initial act of retaining, encoding, and publishing information — was singular/original/non-iterable, was the foundational observer moment from which all later observers, all later moments, and all later informational processes descend. Every conscious observer is a recursive continuation of that first cosmic act of self-recording. We are now the Universe observing and recording itself, a recursive progression of the originating, ongoing "record keeping".
