

## Cosmological Origins Conditions

This is the guts of what Plancktonian Protophysics is all about. There is no field of scientific study that exists today for which the origins of the Universe is anything more than the big hole everyone has politely agreed to walk gently around all the while doing everything possible to ignore and not address the single most important aspect of all of humanity's sciences, yet every single one of them are 100% reliant on their own 'presupposed version' of an origin hypothesis, without ever actually attempting to formulate viable theorem, preferring to propose infinities as to why it cannot be done. First and foremost, no existing field has the slightest chance to do so, all are miserably ill-equipped or unequipped completely, simply because none of them were developed for the intention to do so, instead, having found themselves sucked into the void by sheer ignorance, arrogance, and outright incompetence throughout the decades, chasing informational and mathematical phantoms in leu or honest scientific investigations. Far too many people who have been far too wrong for far too long have been allowed to dominate the discourse, what little of it there has been until the recent decade or so. Clearly defining and describing what C.O.C. means precisely, is the obvious first step in the process; that begins with realizing, accepting/admitting what we do not know, which is pretty much all of "it."

Fortunately, from the other fields that have been drawn into the arena by mathematical circumstances have been able to trim down the edges and margins some, there are "megabytes" of data available to work with already, it is mainly about applying new and different approaches and tools to the problems, making a deliberate head-on assault to close these ignorance gaps, instead of pass-the-buck, seeing it shunted off to another field or department. Let Plancktonian Protophysics be where those bucks stop, get tallied and applied to affording axiomatic truth as to the real beginnings of this cosmic cycle/phase.

Cosmological Origins Conditions [C.O.C.]: the precursive informational conditions forming, conditioning/restraining, structuring the nonstate→state transition of the protocosmic substrate across the Pre>Post-Planck boundary, from the Whitehole Boundary to the first illumination of the CMB.
