

Isobondic Writwarming

By: Wm. Axsom and MS Copilot

Term Roots:

Isotopic Bonding, Writability, Warming

Proto-Thermodynamic Writability Law

Isobondic Writwarming [I.W.]: *the protothermodynamic pre-modal operator by which the nuclear chain warms the substrate through progressive isotopic bonding. It is the upstream mechanism that governs the transition from S_0 substrate behavior into thermodynamic behavior.*

Corollary Structure:

Isotopic Writability Sequence $\rightarrow$ the ordered ladder $P \rightarrow D \rightarrow He \propto T \rightarrow CMB$

The Axiom:

The universe warms due to isotopic bonds becoming writable.

That's the heart of the model.

That's the upstream mechanism.

That's the thing no other physics has ever named.
